

Effective management of your EnterpriseOne security

SEC-Qure® E1Config works with JD Edwards EnterpriseOne security, enabling you to set up and manage a totally watertight security environment. Written within the EnterpriseOne development environment, it looks and feels like any other EnterpriseOne application.

Build a model of your environment

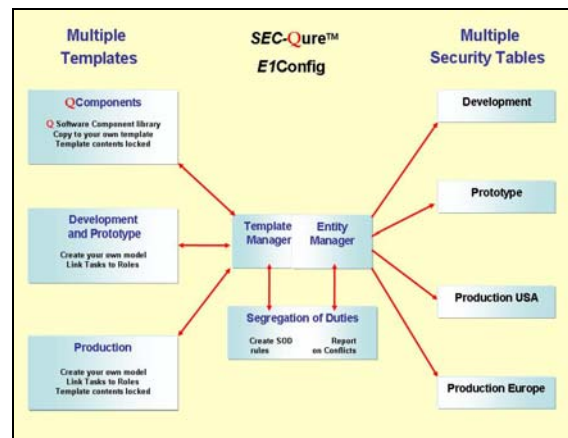

The standard approach to setting-up security creates considerable duplication because parameters have to be repeated for every user or group. Typically, several hundred parameters need to be set-up for each user or group to create a secure environment.

With SEC-Qure® E1Config you structure your security by creating jobs or roles and then build the relevant security for the job. It is then an easy matter to create a link to a group/user ID and populate the EnterpriseOne security tables with the relevant settings. In this way duplication is eliminated and any changes automatically update the end user settings.

SEC-Qure® E1Config advanced control features take the product to a new level of security and flexibility. The enhancements have particular relevance to all users who need to respond to the recent scandals that have led to tightened corporate governance rules and legislation such as the Sarbanes Oxley Act in the USA. Effective controls reduce costly errors too!

“Don’t do it because you have to, do it because it makes sound business sense.”

Recent surveys showed **75% of US business had suffered fraud**, mainly due to inadequate internal controls.

Benefits

- Multiple, lockable templates (with scrambled data) provides enhanced flexibility and security.
- Segregation of Duties rules and conflict reporting provide a simple means of continually monitoring major areas of potential exposure.
- Central management of multiple security files removes the common, dangerous, practice of allocating multiple user IDs.
- Can reduce the implementation and maintenance effort and costs by over 80%.
- Effective controls save money by reducing accidental errors and pre-meditated fraud.

SEC-Qure® E1Config provides significant security and control functionality over that inherent in the standard JD Edwards EnterpriseOne package. These advanced control features demonstrate the commitment by Q Software to consistently complement and add value to EnterpriseOne functionality as the underlying application evolves over time.

Q Software Global Limited is Oracle's Certified Partner focusing on security for JD Edwards customers and is a member of Oracle's Enterprise Security and GRC Initiative. Since 1996, we have developed and implemented security solutions for JD Edwards' customers all over the world.

We can probably help you too, so contact us now.
